Key words: Hemiptera, leafhoppers, *Arboridia*, Iberian Peninsula, distribution.

Palabras clave: Hemiptera, cigarrillas, *Arboridia*, Península Ibérica, distribución.

SUMMARY

The genus *Arboridia* comprises about fifteen species in Europe. Of these, only two species, *A. parvula* and *A. ribauti*, had been recorded to Spain. This work reports *Arboridia erecta* for the first time to the Iberian Peninsula. Food-plant associations, preferable habitats and data on distribution on the Northwest of Spain are provided for *A. parvula* and *A. erecta*.

RESUMEN

El género *Arboridia* comprende alrededor de quince especies en Europa. Sólo dos de ellas: *A. parvula* y *A. ribauti*, habían sido citadas para España. En este trabajo se cita por vez primera la presencia de *Arboridia erecta* en la Península Ibérica. Para esta especie y para *A. parvula* se dan datos sobre las plantas nutricias, hábitats preferenciales y distribución en el noroeste de España.

INTRODUCTION

Leafhoppers of the genus *Arboridia* are very similar morphologically. Most species feed on leaf-mesophyll tissue of deciduous trees and shrubs. Some species are, however, able to switch from natural ecosystems to cultures becoming pests to vineyards in the Palaearctic and Oriental Regions (Vidano, 1967; Vidano & Arzone, 1983; Vidano *et al.*, 1988; Bournier, 1976); at least six species of this genus are pests to *Vitis vinifera*. Of these: *A. dalmatina* infests vineyards in Europe, Bulgaria and former Yugoslavia, *A. adanae* in Turkey and Israel, *A. hussaini* in Iraq, *A. kermanshah* in Iran, *A. viniferata* in India and *A. apicalis* in Japan (Mostaan & Akhbarzadeh, 1995; Sohi *et al.*, 1975; Sohi & Sandhu, 1971; Tanaka *et al.*, 1986; Vidano & Arzone, 1983).

Successful control of these pest species requires a complete knowledge of their taxonomy together with other detailed studies on their biology, ecology, distribution, phytopathology and epidemiology (Vidano & Arzone, 1983). This genus is still poorly understood in Spain and Portugal despite these countries' being important growers of vine which are seriously affected by leafhoppers (López *et al.*, 1998; Quartau, *et al.*, 1989; Quartau & Rebelo, 1992; Ruiz Castro & Mendizabal, 1939; Ruiz Castro, 1943). The only two species recorded in the Iberian Peninsula, *A. parvula* and *A. ribauti*, are also two of the Europe's most widespread species (Nast, 1972, 1987; Morris, 1983).

This work provides new records and information on distribution and host plants, which may lead to a better understanding of the ecology and distribution of the species of this genus.

MATERIAL AND METHODS

Specimens were sampled by sweeping with a net on plant foliage. Male genitalia were macerated in 10% KOH, then rinsed in distilled water and placed in a drop of glycerine to be examined under the stereomicroscope. For an accurate identification of leafhoppers it is useful and sometimes necessary to know also host plant associations and so a list of food plants has been compiled from the literature (Table I).

Twenty eight male specimens were examined. Females of *A. erecta* and *A. parvula* are difficult to distinguish. In this study they could not be ascribed to male specimens from the same sample, because these two species coexist contemporaneously in the same localities and feed upon the same plants.

Table I.—Food plants reported in the scientific literature for the two leafhopper species (1= Arzone & Vidano, 1987; 1= Dworakowska, 1970; 3= Günthart, 1971; 4= Günthart, 1987a; 5= Günthart, 1987b; 6= Günthart, 1987c; 7= Jankovic, 1984; 8= Le Quesne & Payne, 1981; 9= Linnauori, 1952; 10= Moravskaja, 1948; 11= Ossiannilsson, 1981; 12= Ribaut, 1936; 13= Schiemenz, 1990; 14= Vidano *et al.*, 1987a; 15= Vidano *et al.*, 1987b).

RESULTS AND DISCUSSION

Arboridia erecta and *Arboridia parvula* are externally very similar in colour and appearance. The main differences among these species are found in the shape of the aedeagus, styles and anal horns of the male genital structures. There are also some differences in size and colour pattern: the body of *A. erecta* is larger and the coloured band present along the cubital cell is different (Ribaut, 1936).

These two species were sampled in the provinces of Lugo and Orense in the northwest of the Iberian Peninsula. Both coexist in the same locations and on the same plant, *Castanea sativa*, where they are considerably abundant. In Switzerland and Italy these two species are also associated with chestnut trees (Günthart, 1987a, 1987b; Vidano & Arzone, 1987a). In these two countries both species seem to be oligophagous, although a list of published host-plant records (Table I) shows that they feed on plants from several other families. Most of their host plants belong to the families *Corylaceae*, *Fagaceae*, *Rosaceae*, *Betulaceae* and *Ulmaceae*, as shown in table I. Although it is unknown why geographic variation in host associations exist within the same species, similar results have been frequently registered for other species of the same subfamily.

Arboridia erecta (Ribaut, 1931)

This species is very easy to identify according to the shape of the male aedeagus and the apical part of the style (Moravskaja, 1948; Ribaut, 1936). In most specimens examined the lateral spines of the aedeagus are separated from the main branch, in a similar way to Ribaut's drawings (1936). A few individuals, however, showed a smaller distance between both structures.

A. erecta is a polyphagous species which feeds on deciduous tree species of several plant families (Günthart, 1971, 1987a, 1987b, 1987c; Jankovic, 1984). Most host plants belong to the families: *Fagaceae*, *Corylaceae*, *Aceraceae* and *Rosaceae* (Table I). It is recorded here for the first time in the Iberian Peninsula but is known in central and southern Europe, occurring from the Iberian Peninsula to southern Asia (Nast, 1972, 1987).

Material examined.— LUGO: Ribeira de Arriba, Quiroga, 600-700 m, 21.8.1994, 2 ♂♂, found after sweeping on different trees such as *Ulmus* sp. and *Corylus avellana*. Fistéus, Quiroga, 42° 30' N, 7° 12' W, 700 m, 21.8.1994, 7 ♂♂, on *Castanea sativa* Mill. ORENSE: Cerdeiras, Mouruás, 42° 21' N, 7° 17' W, 690 m, 21.8.94, 7 ♂♂, on *Castanea sativa*. All specimens were collected on chest nuts growing with *Quercus* spp. in coppices next to agriculture fields.

Arboridia parvula (Boheman, 1845)

This species can be identified according to the shape of male aedeagus and stylus (Ribaut, 1936; Ossiannilsson, 1981).

In Finland and Switzerland it hibernates in the adult stage and has two generations per year, the adults being present throughout the summer (Günthart, 1987b; Linnavuori, 1952). Overwintering specimens have been observed in coniferous plants such as *Juniperus* (Günthart, 1987b; Schiemenz, 1990). In Spain this species was collected in summer on *Castanea sativa*. In Switzerland it is reported to be oligophagous and associated with *Filipendula ulmaria* and *Rubus idaeus* (Günthart, 1987b). On the other hand, the food-plant records published for several European countries, compiled in this study (Table I), show that this species is polyphagous, its host plants belonging to the families: *Rosaceae* (Dworakowska, 1970; Linnavuori, 1952; Moravskaja, 1948), *Ulmaceae* (Moravskaja, 1948), *Corylaceae* (Arzone & Vidano, 1987) and *Geraniaceae* (Moravskaja, 1948). In Italy adults have also been collected on plant species of the families *Fagaceae* and *Betulaceae* (Vidano & Arzone, 1987a, 1987b) but Le Quesne & Payne (1981) believe that *Helianthemum* (*Cistaceae*) may also be a food plant.

A. parvula is a Euro-Siberian species (Drosopoulos *et al.*, 1986; Nast, 1972, 1987) being present also in north Africa. In Spain, apart from Galicia, it has been recorded at Güejar in Granada (Chicote, 1880) and Calella in Barcelona (Cuní i Martorell, 1896).

Material examined.-LUGO: Ribeira de Arriba-Quiroga, 600-700 m, 21.8.1994, 3 ♂♂, found after sweeping on *Ulmus* and *Corylus avellana*. ORENSE: Cerdeiras, Mouruás, 42° 21' N, 7° 17' W, 790 m, 21.8.94, 8 ♂♂, on *Castanea sativa*. Viana do Bolo, Mouruás, 42° 10' N, 7° 5' W, 780 m, 21.8.1994, 1 ♂, after swiping on *Corylus avellana* and *Ulmus* sp. All specimens were sampled in areas containing clusters of chest nuts and oaks situated on mountain slopes, close to cultivated fields.

ACKNOWLEDGEMENTS

I thank Mario Franco and Domingos Rodriguez for their help with the translation of German and Russian literature respectively.
