## Question

Under what conditions a closed (n-1)-dimensional embedded submanifold  $\Lambda$  of  $\mathbb{R}^{n+1}$  spans a compact hypersurface of constant (extrinsic) curvature?

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

• Let  $\Omega \subset \mathbb{S}^n$  be a bounded smooth domain.

- Let  $\Omega \subset \mathbb{S}^n$  be a bounded smooth domain.
- ▶ The radial graph of a positive function  $\rho \in C^2(\bar{\Omega})$  is the hypersurface

$$\Sigma = \{X(x) = \rho(x)x : x \in \overline{\Omega}\} \subset \mathbb{R}^{n+1}$$

.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- Let  $\Omega \subset \mathbb{S}^n$  be a bounded smooth domain.

**Theorem (— '15)** Assume that  $\overline{\Omega} \subset \mathbb{S}^n_+$  is a mean convex domain. Then, for 0 < R < n(n-1), there exists a radial graph  $\Sigma$  of constant scalar curvature R and boundary  $\partial \Sigma = \partial \Omega$ .

# **Curvature Functions**

<□ > < @ > < E > < E > E のQ @

## **Curvature Functions**

Let  $\Gamma$  be an open, convex, symmetric cone  $\Gamma \subset \mathbb{R}^n$  with vertex at the origin and containing the positive cone

$$\Gamma^+ = \{ \kappa \in \mathbb{R}^n : \text{ each component } \kappa_i > 0 \}.$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

## **Curvature Functions**

Let  $\Gamma$  be an open, convex, symmetric cone  $\Gamma \subset \mathbb{R}^n$  with vertex at the origin and containing the positive cone

$$\Gamma^+ = \{ \kappa \in \mathbb{R}^n : \text{ each component } \kappa_i > 0 \}.$$

We say that  $f: \Gamma \longrightarrow (0, +\infty)$  is a *curvature function* if it satisfies

Symmetry: 
$$f(\lambda_1, ..., \lambda_n) = f(\lambda_{\sigma(1)}, ..., \lambda_{\sigma(n)})$$
, for all  $\sigma$ ;

Ellipticity: 
$$f_i = \frac{\partial f}{\partial \lambda_i} > 0;$$

Concavity: *f* is a concave function;

~ ~

Homogeneity:  $f(t\lambda) = tf(\lambda), t > 0;$ 

Compatibility:

$$\limsup_{\lambda \to \partial \Gamma} f(\lambda) = 0;$$

#### Technical assumptions

For every constant C > 0 and every compact set E in Γ there is a constant R = R(C, E) > 0 such that

$$f(\lambda_1, \cdots, \lambda_n + R) \ge C$$
, for all  $\lambda \in E$ , (1)

• For all  $\lambda \in \Gamma_{\mu,\nu} = \{\lambda \in \Gamma : \mu < f(\lambda) < \nu\}$  it holds

$$\sum f_i(\lambda)\lambda_i^2 \leqslant C_0(\lambda_j\chi_{\{\lambda_j>0\}} + \sum_{k\neq j} f_k(\lambda)\lambda_k^2).$$
(2)

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

# Main Theorem

#### Theorem

Let  $\Omega$  be a smooth bounded domain such that  $\overline{\Omega} \subset \mathbb{S}^n_+$  and  $H_{\partial\Omega} \ge 0$ , and let  $\psi$  be a smooth positive function defined on  $\overline{\Omega}$ . Assume f satisfy (1)-(2) and there exists a smooth admissible <sup>1</sup> radial graph  $\bar{\Sigma}$ :  $\bar{X}(x) = \bar{\rho}(x)x$  over  $\bar{\Omega}$  that satisfies

$$f(\kappa_{\bar{\Sigma}}[X]) > \psi(x) \quad in \ \Omega,$$
  
$$\bar{\rho} = \phi \quad on \ \partial\Omega$$

and is locally strictly convex (up to the boundary) in a neighbourhood of  $\partial \Omega$ . Then there exists a smooth radial graph  $\Sigma$ :  $X(x) = \rho(x)x$  satisfying

$$f(\kappa_{\Sigma}[X]) = \psi(x) \quad in \ \Omega,$$
  
$$\rho = \phi \quad on \ \partial\Omega.$$

<sup>1</sup> $\Sigma$  is admissible if  $\kappa_{\Sigma}([X]) \in \Gamma$  for all  $X \in \Sigma$ .

Consider the auxiliary functions

$$\Psi^{t}(\rho x) = \left(\frac{\overline{\rho}(x)}{\rho}\right)^{3} \left(t \psi(x) + (1-t)\underline{\psi}(x)\right), \quad t \in [0,1]$$

and

$$\Phi^{s}(\rho x) = s\psi(x) + (1-s)\left(\frac{\overline{\rho}(x)}{\rho}\right)^{3}\psi(x), \quad s \in [0,1]$$

・ロト < 団ト < 三ト < 三ト ・ 三 ・ のへの</li>

defined in the solid cylinder  $\Delta = \{X \in \mathbb{R}^{n+1} : \frac{X}{\|X\|} \in \overline{\Omega}\}.$ 

Consider the auxiliary functions

$$\Psi^{t}(\rho x) = \left(\frac{\overline{\rho}(x)}{\rho}\right)^{3} \left(t\psi(x) + (1-t)\underline{\psi}(x)\right), \quad t \in [0,1]$$

and

$$\Phi^{s}(\rho x) = s\psi(x) + (1-s)\left(\frac{\overline{\rho}(x)}{\rho}\right)^{3}\psi(x), \quad s \in [0,1]$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

defined in the solid cylinder  $\Delta = \{X \in \mathbb{R}^{n+1} : \frac{X}{\|X\|} \in \overline{\Omega}\}.$ 

#### Remark.

- $\Phi^1(\rho x) = \psi(x)$
- ►  $\Psi^1 = \Phi^0$

• 
$$\frac{\partial}{\partial \rho}(\rho \Psi^t(\rho x)) \leq 0$$

•  $\frac{\partial}{\partial \rho}(\rho \Phi^{s}(\rho x)) \leqslant 0$  if  $\rho \leqslant \overline{\rho}$ .

Consider the auxiliary equations

$$H(\nabla^2 v, \nabla v, v) = \Psi^t(X) \quad \text{in } \Omega$$
  
$$v = -\ln \phi \quad \text{on } \partial \Omega \qquad (EqA)_t \tag{3}$$

and

$$H(\nabla^2 v, \nabla v, v) = \Phi^s(X) \quad \text{in } \Omega$$
  
$$v = -\ln \phi \quad \text{on } \partial \Omega \qquad (EqB)_s \tag{4}$$

・ロト < 団ト < 三ト < 三ト ・ 三 ・ のへの</li>

Consider the auxiliary equations

$$H(\nabla^2 \mathbf{v}, \nabla \mathbf{v}, \mathbf{v}) = \Psi^t(X) \quad \text{in } \Omega$$
  
$$\mathbf{v} = -\ln \phi \quad \text{on } \partial \Omega \qquad (EqA)_t \tag{3}$$

and

$$H(\nabla^2 v, \nabla v, v) = \Phi^s(X) \quad \text{in } \Omega$$
  
$$v = -\ln \phi \quad \text{on } \partial \Omega \qquad (EqB)_s \tag{4}$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

#### Remark.

- $\underline{v} = -\ln \overline{\rho}$  is a solution of  $(EqA)_0$
- $\underline{v} = -\ln \overline{\rho}$  is a strictly subsolution of  $(EqA)_t$  for each t > 0

► 
$$\frac{\partial}{\partial v}(H - \Psi^t) \leq 0$$

 $\blacktriangleright (EqA)_1 = (EqB)_0.$ 

# A priori estimates

Theorem Let  $v \ge \underline{v}$  be an admissible solution of

$$f(\kappa_{\Sigma}[X]) = \Upsilon(X) \quad in \ \Omega$$
$$v = \varphi \quad on \ \partial\Omega.$$

Suppose  $\frac{\partial}{\partial\rho}(\rho\Upsilon)\leqslant 0.$  Then we have the estimate

$$\|v\|_{C^2(\bar{\Omega})} \leq C$$

where C depends on  $\inf_{\Omega} \underline{v}, \|\underline{v}\|_{C^{2}(\overline{\Omega})}, \|\Upsilon\|_{C^{2}(\Delta_{L})}$ , the convexity of  $\overline{\Sigma}$  in a neighbourhood of  $\partial\Omega$  and other known data.

It follows from the a priori estimates that

- There exists a unique solution  $v^0$  of  $(EqB)_0$ .
- ▶ If  $v^s$  is a solution of  $(EqB)_s$  and  $v^s \ge v$  then

 $\|\mathbf{v}^{\mathbf{s}}\|_{C^{4,\alpha}(\bar{\Omega})} < C_1.$ 

It follows from the a priori estimates that

- There exists a unique solution  $v^0$  of  $(EqB)_0$ .
- ▶ If  $v^s$  is a solution of  $(EqB)_s$  and  $v^s \ge \underline{v}$  then

$$\|v^{\mathfrak{s}}\|_{C^{4,\alpha}(\bar{\Omega})} < C_1.$$

Consider the open set

$$\begin{split} \mathfrak{O} &= \{ w \in C_0^{4,\alpha}(\bar{\Omega}) : w > 0 \text{ in } \Omega, \, \nabla_n w > 0 \text{ on } \partial\Omega, \\ & w + \underline{v} \text{ is admissible and } \|w\|_{C^{4,\alpha}(\bar{\Omega})} \leqslant C_1 + \|\underline{v}\|_{C^{4,\alpha}(\bar{\Omega})} \}. \end{split}$$

and the map

$$M_{s}[w] = H(\nabla^{2}(w + \underline{v}), \nabla(w + \underline{v}), w + \underline{v}) - \Phi^{s}(w + \underline{v}), \quad w \in \mathcal{O}.$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

It follows from the a priori estimates that

- There exists a unique solution  $v^0$  of  $(EqB)_0$ .
- ▶ If  $v^s$  is a solution of  $(EqB)_s$  and  $v^s \ge \underline{v}$  then

$$\|\boldsymbol{v}^{\boldsymbol{s}}\|_{C^{4,\alpha}(\bar{\Omega})} < C_1.$$

Consider the open set

$$\begin{split} \mathfrak{O} &= \{ w \in C_0^{4,\alpha}(\bar{\Omega}) : w > 0 \text{ in } \Omega, \, \nabla_n w > 0 \text{ on } \partial\Omega, \\ & w + \underline{v} \text{ is admissible and } \|w\|_{C^{4,\alpha}(\bar{\Omega})} \leqslant C_1 + \|\underline{v}\|_{C^{4,\alpha}(\bar{\Omega})} \}. \end{split}$$

and the map

$$M_{s}[w] = H(\nabla^{2}(w + \underline{v}), \nabla(w + \underline{v}), w + \underline{v}) - \Phi^{s}(w + \underline{v}), \quad w \in \mathcal{O}.$$

We have

- $w^0 = v^0 \underline{v}$  is the unique solution of  $M_0[w] = 0$  in  $\mathbb{O}$
- There is no solution of  $M_s[w] = 0$  on  $\partial O$
- ► The Fréchet derivative of  $M_0$  at  $w^0$  is invertible.

Then, by the degree theory developed by Yan Yan Li<sup>2</sup>, we can see that the degree of  $M_s$  on  $\bigcirc$  at  $0 \deg(M_s, \bigcirc, 0, 0)$  is well defined and independet of *s*. Moreover,

$$\mathsf{deg}(M_0, \mathfrak{O}, 0) = \pm 1 \neq 0$$

and we conclude that

$$\deg(M_s, \mathfrak{O}, 0) \neq 0 \text{ for all } s \in [0, 1].$$

Let  $w^1$  be a solution of  $M_1[w] = 0$ . Then the function  $v^1 = w^1 + \underline{v}$  is the desired solution.

## Height and Gradient Bounds

Let  $\underline{\rho}$  be the solution of the minimal surface equation in  $\Omega$  that satisfies  $\underline{\rho}=\overline{\varphi}$  on  $\partial\Omega.$  Then

$$\rho \leqslant \rho \leqslant \overline{\rho} \quad \text{in } \Omega$$

and

$$\underline{\rho} = \rho = \overline{\rho} \quad \text{on } \partial\Omega.$$

This yelds the height and boundary gradient estimates.

## Height and Gradient Bounds

Let  $\underline{\rho}$  be the solution of the minimal surface equation in  $\Omega$  that satisfies  $\underline{\rho}=\overline{\varphi}$  on  $\partial\Omega.$  Then

$$\rho \leqslant \rho \leqslant \overline{\rho} \quad \text{in } \Omega$$

and

$$\underline{\rho} = \rho = \overline{\rho} \quad \text{on } \partial\Omega.$$

This yelds the height and boundary gradient estimates.

Under the condition

$$\frac{\partial}{\partial \rho} (\rho \Upsilon(\rho x)) \leqslant 0,$$

the interior gradient estimate follows as in the paper Caffarelli, L., Nirenberg L. and Spruck, J., The Dirichlet Problem for Nonlinear Second-Order Elliptic Equations IV: Starshaped compact Weingarten hypersurfaces (1985).

# Height and Gradient Bounds

Let  $\underline{\rho}$  be the solution of the minimal surface equation in  $\Omega$  that satisfies  $\underline{\rho}=\overline{\varphi}$  on  $\partial\Omega.$  Then

$$\rho \leqslant \rho \leqslant \overline{\rho} \quad \text{in } \Omega$$

and

$$\underline{\rho} = \rho = \overline{\rho} \quad \text{on } \partial\Omega.$$

This yelds the height and boundary gradient estimates.

Under the condition

$$\frac{\partial}{\partial \rho} (\rho \Upsilon(\rho x)) \leqslant 0,$$

the interior gradient estimate follows as in the paper Caffarelli, L., Nirenberg L. and Spruck, J., The Dirichlet Problem for Nonlinear Second-Order Elliptic Equations IV: Starshaped compact Weingarten hypersurfaces (1985).

**Remark.** Once established the second derivative boundary estimates, the interior ones follow as above.

## The Barrier Method

Set

 $u = 1/\rho$  and  $\phi = 1/\phi$ .

The mixed second derivative boundary estimates are obtained applying the barrier method to the function  $\nabla_{\alpha} u$ . We will make use of the following version of the Maximum Principle.

Theorem (Maximum Principle) Let  $v, w \in C^2(\overline{\Omega})$  and u an admissible function on  $\Omega$ . Assume that  $G^{ij}\nabla_{ij}w \leq C_0(1+|\nabla w|)$  in U

$$G^{ij}\nabla_{ij}v \ge C_0(1+|\nabla v|)$$
 in  $U$ ,

where  $C_0$  is a constant and  $U \subset \Omega$ . If  $v \leq w$  on  $\partial U$ , then  $v \leq w$  in  $\overline{U}$ .

## The Barrier Method

Set

 $u = 1/\rho$  and  $\phi = 1/\varphi$ .

The mixed second derivative boundary estimates are obtained applying the barrier method to the function  $\nabla_{\alpha} u$ . We will make use of the following version of the Maximum Principle.

Theorem (Maximum Principle) Let  $v, w \in C^2(\overline{\Omega})$  and u an admissible function on  $\Omega$ . Assume that  $G^{ij}\nabla_{ij}w \leqslant C_0(1+|\nabla w|)$  in U

$$G^{ij}\nabla_{ij}v \ge C_0(1+|\nabla v|)$$
 in  $U_{ij}$ 

where  $C_0$  is a constant and  $U \subset \Omega$ . If  $v \leq w$  on  $\partial U$ , then  $v \leq w$  in  $\overline{U}$ .

Rmk:

$$u = 1/\rho \quad \Rightarrow \quad G(\nabla^2 u, \nabla u, u) = \Upsilon$$
$$G^{ij} = \frac{\partial G}{\partial \nabla_{ij} u}$$

#### Lemma (Fundamental Inequality)

For some positive constants K and M sufficiently large depending on  $||u||_{C^1(\bar{\Omega})}$ ,  $||\Upsilon||_{C^1(\Delta_L)}$  and other known data, the function

$$\Phi = \nabla_k (u - \varphi) - \frac{\kappa}{2} \sum_{l < n} \left( \nabla_l (u - \varphi) \right)^2$$

satisfies

$$G^{ij}\nabla_{ij}\Phi \leqslant M(1+|\nabla\Phi|+G^{ij}\delta_{ij}+G^{ij}\nabla_i\Phi\nabla_j\Phi) \quad in \quad \Omega_{\delta}.$$

#### Lemma (Fundamental Inequality)

For some positive constants K and M sufficiently large depending on  $||u||_{C^1(\bar{\Omega})}$ ,  $||\Upsilon||_{C^1(\Delta_L)}$  and other known data, the function

$$\Phi = \nabla_k (u - \varphi) - \frac{\kappa}{2} \sum_{l < n} \left( \nabla_l (u - \varphi) \right)^2$$

satisfies

$$G^{ij} 
abla_{ij} \Phi \leqslant M(1 + |
abla \Phi| + G^{ij} \delta_{ij} + G^{ij} 
abla_i \Phi 
abla_j \Phi) \quad in \quad \Omega_{\delta}.$$

We choose

$$w = 1 - e^{-a_0 \Phi} + b_0(u - \underline{u})$$

to get

$$G^{ij}\nabla_{ij}w \leqslant C_0(1+|\nabla w|).$$

# **Barrier Function**

#### Lemma

There exist some uniform positive constants t,  $\delta$ ,  $\varepsilon$  sufficiently small and N sufficiently large depending on  $\inf_{\overline{\Omega}} \underline{u}$ ,  $\|\underline{u}\|_{C^2(\overline{\Omega})}$ ,  $\sup_{\Delta_L} \Upsilon$ , the convexity of  $\underline{u}$  in a neighbourhood of  $\partial\Omega$  and other known data, such that the function

$$\Theta = u - \underline{u} + td - Nd^2, \quad d = dist(\cdot, \partial\Omega)$$

satisfies

$${{{\cal G}}^{ij} \nabla_{ij} \Theta \leqslant - (1 + |\nabla \Theta| + {{\cal G}}^{ij} \delta_{ij}) \quad {\it in} \; \Omega_{\delta}}$$

and

 $\Theta \geqslant 0 \quad \text{on } \partial \Omega_{\delta}.$ 

# **Barrier Function**

#### Lemma

There exist some uniform positive constants t,  $\delta$ ,  $\varepsilon$  sufficiently small and N sufficiently large depending on  $\inf_{\overline{\Omega}} \underline{u}$ ,  $\|\underline{u}\|_{C^2(\overline{\Omega})}$ ,  $\sup_{\Delta_L} \Upsilon$ , the convexity of  $\underline{u}$  in a neighbourhood of  $\partial\Omega$  and other known data, such that the function

$$\Theta = u - \underline{u} + td - Nd^2, \quad d = dist(\cdot, \partial\Omega)$$

satisfies

$$G^{ij} 
abla_{ij} \Theta \leqslant -(1 + |
abla \Theta| + G^{ij} \delta_{ij}) \quad in \ \Omega_{\delta}$$

and

 $\Theta \geqslant 0 \quad \text{on } \partial \Omega_{\delta}.$ 

We choose

$$v = -c_0 \operatorname{dist}(\cdot, x_0)^2 - d_0 \Theta$$

to get

$$G^{ij}\nabla_{ij}v \geqslant C_0(1+|\nabla v|)$$

and  $v \leq w$  on  $\partial \Omega_{\delta}$ .

Let  $\kappa'$  the roots of det $(h_{\alpha\beta} - tg_{\alpha\beta}) = 0$ . It follows from the previous estimates that the principal curvatures  $\kappa_i$  behave like

$$\begin{aligned} \kappa_{\alpha} &= \kappa_{\alpha}' + o(1), \quad 1 \leqslant \alpha \leqslant n - 1, \\ \kappa_{n} &= \frac{h_{nn}}{g_{nn}} \left( 1 + O\left(\frac{1}{h_{nn}}\right) \right), \end{aligned}$$

(ロ)、(型)、(E)、(E)、 E) の(の)

as  $|h_{nn}| \to \infty$ .

Let  $\kappa'$  the roots of det $(h_{\alpha\beta} - tg_{\alpha\beta}) = 0$ . It follows from the previous estimates that the principal curvatures  $\kappa_i$  behave like

$$\begin{aligned} \kappa_{\alpha} &= \kappa_{\alpha}' + o(1), \quad 1 \leqslant \alpha \leqslant n - 1, \\ \kappa_{n} &= \frac{h_{nn}}{g_{nn}} \left( 1 + O\left(\frac{1}{h_{nn}}\right) \right), \end{aligned}$$

as  $|h_{nn}| \to \infty$ . Let  $\Gamma'$  be the projection of  $\Gamma$  on  $\mathbb{R}^{n-1}$ . Thus, there exists a uniform positive constant  $N_0 > 0$  satisfying

$$\kappa' \in \Gamma' \quad \text{if} \quad \nabla_{nn} u \geqslant N_0. \quad (*)$$

Let  $\kappa'$  the roots of det $(h_{\alpha\beta} - tg_{\alpha\beta}) = 0$ . It follows from the previous estimates that the principal curvatures  $\kappa_i$  behave like

$$\begin{aligned} \kappa_{\alpha} &= \kappa_{\alpha}' + o(1), \quad 1 \leqslant \alpha \leqslant n - 1, \\ \kappa_{n} &= \frac{h_{nn}}{g_{nn}} \left( 1 + O\left(\frac{1}{h_{nn}}\right) \right), \end{aligned}$$

as  $|h_{nn}| \to \infty$ . Let  $\Gamma'$  be the projection of  $\Gamma$  on  $\mathbb{R}^{n-1}$ . Thus, there exists a uniform positive constant  $N_0 > 0$  satisfying

$$\kappa' \in \Gamma'$$
 if  $\nabla_{nn} u \ge N_0$ . (\*)

#### Lemma

Let  $N_0 > 0$  be the constant defined in (\*) and suppose that  $\nabla_{nn} u \ge N_0$ . Then there exists a uniform constant  $c_0 > 0$  such that

$$d(x) = dist(\cdot, \partial \Gamma') \ge c_0 \quad on \ \partial \Omega.$$

Therefore an upper bound for  $\kappa_n$  follows from the previous established estimates and the assumption that f is of unbounded type.
