$$\sigma(x) = \{\lambda \in \mathbb{C} : \lambda \mathbf{1} - x \notin G(A)\};$$

and we use  $\sigma'(x) = \sigma(x) \setminus \{0\}$  to denote its **nonzero spectrum**.

# Some Terminology

- A map  $\phi : A \rightarrow B$  is **spectrum-preserving** if  $\sigma(x) = \sigma(\phi(x))$  for all  $x \in A$ ;

# Some Terminology

- A map  $\phi : A \rightarrow B$  is **spectrum-preserving** if  $\sigma(x) = \sigma(\phi(x))$  for all  $x \in A$ ; and  $\phi$  is **unital** if  $\phi(\mathbf{1}) = \mathbf{1}$ .

# Some Terminology

- A map  $\phi : A \rightarrow B$  is **spectrum-preserving** if  $\sigma(x) = \sigma(\phi(x))$  for all  $x \in A$ ; and  $\phi$  is **unital** if  $\phi(\mathbf{1}) = \mathbf{1}$ .
- We also mention that a Banach algebra  $A$  is **semisimple** if its Jacobson radical,  $\text{rad}(A)$ , is  $\{\mathbf{0}\}$ .

# Some Terminology

- A map  $\phi : A \rightarrow B$  is **spectrum-preserving** if  $\sigma(x) = \sigma(\phi(x))$  for all  $x \in A$ ; and  $\phi$  is **unital** if  $\phi(\mathbf{1}) = \mathbf{1}$ .
- We also mention that a Banach algebra  $A$  is **semisimple** if its Jacobson radical,  $\text{rad}(A)$ , is  $\{\mathbf{0}\}$ .
- Equivalently,  $A$  is **semisimple** if  $\sigma(x + y) = \sigma(y)$  for all  $y \in A$  implies  $x = \mathbf{0}$ . (Zemánek)

# Some Terminology

- A map  $\phi : A \rightarrow B$  is **spectrum-preserving** if  $\sigma(x) = \sigma(\phi(x))$  for all  $x \in A$ ; and  $\phi$  is **unital** if  $\phi(\mathbf{1}) = \mathbf{1}$ .
- We also mention that a Banach algebra  $A$  is **semisimple** if its Jacobson radical,  $\text{rad}(A)$ , is  $\{\mathbf{0}\}$ .
- Equivalently,  $A$  is **semisimple** if  $\sigma(x + y) = \sigma(y)$  for all  $y \in A$  implies  $x = \mathbf{0}$ . (Zemánek)
- A two-sided ideal  $J$  of a Banach algebra is said to be **essential** if it has a nonzero intersection with every nonzero ideal in the Banach algebra.

# Some Terminology

- A map  $\phi : A \rightarrow B$  is **spectrum-preserving** if  $\sigma(x) = \sigma(\phi(x))$  for all  $x \in A$ ; and  $\phi$  is **unital** if  $\phi(\mathbf{1}) = \mathbf{1}$ .
- We also mention that a Banach algebra  $A$  is **semisimple** if its Jacobson radical,  $\text{rad}(A)$ , is  $\{\mathbf{0}\}$ .
- Equivalently,  $A$  is **semisimple** if  $\sigma(x + y) = \sigma(y)$  for all  $y \in A$  implies  $x = \mathbf{0}$ . (Zemánek)
- A two-sided ideal  $J$  of a Banach algebra is said to be **essential** if it has a nonzero intersection with every nonzero ideal in the Banach algebra.
- If the Banach algebra is semisimple, then this is equivalent to saying that the condition  $xJ = \{\mathbf{0}\}$  implies  $x = \mathbf{0}$ .

# Some Terminology

- A map  $\phi : A \rightarrow B$  is **spectrum-preserving** if  $\sigma(x) = \sigma(\phi(x))$  for all  $x \in A$ ; and  $\phi$  is **unital** if  $\phi(\mathbf{1}) = \mathbf{1}$ .
- We also mention that a Banach algebra  $A$  is **semisimple** if its Jacobson radical,  $\text{rad}(A)$ , is  $\{\mathbf{0}\}$ .
- Equivalently,  $A$  is **semisimple** if  $\sigma(x + y) = \sigma(y)$  for all  $y \in A$  implies  $x = \mathbf{0}$ . (Zemánek)
- A two-sided ideal  $J$  of a Banach algebra is said to be **essential** if it has a nonzero intersection with every nonzero ideal in the Banach algebra.
- If the Banach algebra is semisimple, then this is equivalent to saying that the condition  $xJ = \{\mathbf{0}\}$  implies  $x = \mathbf{0}$ .
- A Banach algebra is said to be **prime** if and only if every nonzero two-sided ideal is essential.

# Some Reminders about the Socle

- An important two-sided ideal of a semisimple Banach algebra  $A$  is the **socle**.

# Some Reminders about the Socle

- An important two-sided ideal of a semisimple Banach algebra  $A$  is the **socle**.
- The **socle** of  $A$ , denoted  $\text{soc}(A)$ , is the collection of all finite sums formed by using elements taken from any of the minimal left (or right) ideals of  $A$ .

# Some Reminders about the Socle

- An important two-sided ideal of a semisimple Banach algebra  $A$  is the **socle**.
- The **socle** of  $A$ , denoted  $\text{soc}(A)$ , is the collection of all finite sums formed by using elements taken from any of the minimal left (or right) ideals of  $A$ .
- If the Banach algebra lacks minimal one-sided ideals, then its socle is trivial i.e.  $\{\mathbf{0}\}$ .

## Theorem (Gleason-Kahane-Żelazko, 1967, 1968)

If a linear functional  $f : A \rightarrow \mathbb{C}$  maps every  $x \in A$  into its spectrum  $\sigma(x)$ , then  $f$  is multiplicative.

# Introduction

## Theorem (Gleason-Kahane-Żelazko, 1967, 1968)

If a linear functional  $f : A \rightarrow \mathbb{C}$  maps every  $x \in A$  into its spectrum  $\sigma(x)$ , then  $f$  is multiplicative.

Equivalently, this result says that every unital linear functional mapping every invertible element to a nonzero scalar is multiplicative.

# Introduction

## Theorem (Gleason-Kahane-Żelazko, 1967, 1968)

If a linear functional  $f : A \rightarrow \mathbb{C}$  maps every  $x \in A$  into its spectrum  $\sigma(x)$ , then  $f$  is multiplicative.

Equivalently, this result says that every unital linear functional mapping every invertible element to a nonzero scalar is multiplicative.

**Key observation:** Since  $f$  maps invertible elements of  $A$  to invertible elements of  $\mathbb{C}$ , it is automatically well-behaved with respect to multiplication.

# Introduction

More generally, we say that a map  $\phi : \mathcal{A} \rightarrow \mathcal{B}$  between two algebras **preserves invertibility** if  $\phi(a)$  is invertible in  $\mathcal{B}$  whenever  $a$  is invertible in  $\mathcal{A}$ .

# Introduction

More generally, we say that a map  $\phi : \mathcal{A} \rightarrow \mathcal{B}$  between two algebras **preserves invertibility** if  $\phi(a)$  is invertible in  $\mathcal{B}$  whenever  $a$  is invertible in  $\mathcal{A}$ .

The GKZ Theorem (among others) motivated I. Kaplansky to formulate the problem of determining the conditions under which a unital linear invertibility preserving map  $\phi$  between two algebras must be a Jordan-homomorphism.

# Introduction

More generally, we say that a map  $\phi : \mathcal{A} \rightarrow \mathcal{B}$  between two algebras **preserves invertibility** if  $\phi(a)$  is invertible in  $\mathcal{B}$  whenever  $a$  is invertible in  $\mathcal{A}$ .

The GKZ Theorem (among others) motivated I. Kaplansky to formulate the problem of determining the conditions under which a unital linear invertibility preserving map  $\phi$  between two algebras must be a Jordan-homomorphism.

A **Jordan-homomorphism**  $\phi$  is a linear map with the property that

$$\phi(x^2) = \phi(x)^2 \text{ for all } x \text{ in its domain.}$$

# Introduction

As mentioned by Kaplansky himself, the appropriate setting for the study of these types of maps seems to be between two Banach algebras.

# Introduction

As mentioned by Kaplansky himself, the appropriate setting for the study of these types of maps seems to be between two Banach algebras.

In this context, if  $\phi : A \rightarrow B$  is a unital linear invertibility preserving map between complex Banach algebras  $A$  and  $B$ , then  $\phi$  is **spectrum-compressing**, i.e.

$$\sigma(\phi(a)) \subseteq \sigma(a) \text{ for each } a \in A.$$

# Introduction

As mentioned by Kaplansky himself, the appropriate setting for the study of these types of maps seems to be between two Banach algebras.

In this context, if  $\phi : A \rightarrow B$  is a unital linear invertibility preserving map between complex Banach algebras  $A$  and  $B$ , then  $\phi$  is **spectrum-compressing**, i.e.

$$\sigma(\phi(a)) \subseteq \sigma(a) \text{ for each } a \in A.$$

If, in addition,  $\phi$  actually preserves invertibility in both directions, that is, if  $\phi(a)$  is invertible in  $B$  if and only if  $a$  is invertible in  $A$ , then  $\phi$  is **spectrum-preserving**.

# Introduction

As mentioned by Kaplansky himself, the appropriate setting for the study of these types of maps seems to be between two Banach algebras.

In this context, if  $\phi : A \rightarrow B$  is a unital linear invertibility preserving map between complex Banach algebras  $A$  and  $B$ , then  $\phi$  is **spectrum-compressing**, i.e.

$$\sigma(\phi(a)) \subseteq \sigma(a) \text{ for each } a \in A.$$

If, in addition,  $\phi$  actually preserves invertibility in both directions, that is, if  $\phi(a)$  is invertible in  $B$  if and only if  $a$  is invertible in  $A$ , then  $\phi$  is **spectrum-preserving**.

Since  $0 \in \sigma(a)$  if and only if  $a \notin G(A)$ , we can also work our way back to invertibility preservation.

# Introduction

As a result of this connection to Kaplansky's problem, over the years there has been a surge of literature on linear maps preserving or compressing various parts of the spectrum, or preserving the spectral radius.

# Introduction

## Theorem (Jafarian-Sourour, 1986)

Any surjective and linear spectrum preserving map  $\phi : \mathcal{L}(X) \rightarrow \mathcal{L}(Y)$  satisfies the following: Either

- (a) there exists an invertible bounded linear operator  $U : X \rightarrow Y$  such that  $\phi(T) = UTU^{-1}$  for each  $T \in \mathcal{L}(X)$ , or
- (b) there exists an invertible bounded linear operator  $V : X' \rightarrow Y$  such that  $\phi(T) = VT^*V^{-1}$  for each  $T \in \mathcal{L}(X)$ .

Hence,  $\phi$  is either an (algebra) isomorphism or anti-isomorphism.

# Introduction

## Theorem (Jafarian-Sourour, 1986)

Any surjective and linear spectrum preserving map  $\phi : \mathcal{L}(X) \rightarrow \mathcal{L}(Y)$  satisfies the following: Either

- (a) there exists an invertible bounded linear operator  $U : X \rightarrow Y$  such that  $\phi(T) = UTU^{-1}$  for each  $T \in \mathcal{L}(X)$ , or
- (b) there exists an invertible bounded linear operator  $V : X' \rightarrow Y$  such that  $\phi(T) = VT^*V^{-1}$  for each  $T \in \mathcal{L}(X)$ .

Hence,  $\phi$  is either an (algebra) isomorphism or anti-isomorphism.

This result was then extended in two directions which is of relevance here.

## Theorem (Omladič-Šemrl, 1991)

Any surjective and **additive** spectrum preserving map  $\phi : \mathcal{L}(X) \rightarrow \mathcal{L}(Y)$  satisfies the following: Either

- (a) there exists an invertible bounded linear operator  $U : X \rightarrow Y$  such that  $\phi(T) = UTU^{-1}$  for each  $T \in \mathcal{L}(X)$ , or
- (b) there exists an invertible bounded linear operator  $V : X' \rightarrow Y$  such that  $\phi(T) = VT^*V^{-1}$  for each  $T \in \mathcal{L}(X)$ .

Hence,  $\phi$  is either an (algebra) isomorphism or anti-isomorphism.

# Introduction

## Theorem (Aupetit-Mouton, 1994)

If  $\phi : A \rightarrow B$  is a surjective linear spectrum-preserving map between semisimple Banach algebras and  $\text{soc}(B)$  is essential, then  $\phi$  is a Jordan-isomorphism.

# Introduction

## Theorem (Aupetit-Mouton, 1994)

If  $\phi : A \rightarrow B$  is a surjective linear spectrum-preserving map between semisimple Banach algebras and  $\text{soc}(B)$  is essential, then  $\phi$  is a Jordan-isomorphism.

## Corollary (Aupetit-Mouton, 1994)

If  $\phi : A \rightarrow B$  is a surjective linear spectrum-preserving map between semisimple Banach algebras and  $B$  is a prime Banach algebra with minimal ideals, then  $\phi$  is an isomorphism or an anti-isomorphism.

# Introduction

## Theorem (Aupetit-Mouton, 1994)

If  $\phi : A \rightarrow B$  is a surjective linear spectrum-preserving map between semisimple Banach algebras and  $\text{soc}(B)$  is essential, then  $\phi$  is a Jordan-isomorphism.

## Corollary (Aupetit-Mouton, 1994)

If  $\phi : A \rightarrow B$  is a surjective linear spectrum-preserving map between semisimple Banach algebras and  $B$  is a prime Banach algebra with minimal ideals, then  $\phi$  is an isomorphism or an anti-isomorphism.

**Remark.** Aupetit and Mouton actually considered a slightly more general problem on maps which preserve the full spectrum.

# Introduction

## Theorem (Aupetit-Mouton, 1994)

If  $\phi : A \rightarrow B$  is a surjective **linear spectrum-preserving** map between semisimple Banach algebras and  $\text{soc}(B)$  is essential, then  $\phi$  is a Jordan-isomorphism.

## Corollary (Aupetit-Mouton, 1994)

If  $\phi : A \rightarrow B$  is a surjective linear spectrum-preserving map between semisimple Banach algebras and  $B$  is a prime Banach algebra with minimal ideals, then  $\phi$  is an isomorphism or an anti-isomorphism.

**Remark.** Aupetit and Mouton actually considered a slightly more general problem on maps which preserve the full spectrum.

# Finite Rank Elements and the Socle

- Following B. Aupetit and H. du T. Mouton, we define the **rank** of  $a \in A$  by

$$\text{rank}^\sigma(a) = \sup_{x \in A} \#\sigma'(xa) \leq \infty.$$

# Finite Rank Elements and the Socle

- Following B. Aupetit and H. du T. Mouton, we define the **rank** of  $a \in A$  by

$$\text{rank}^\sigma(a) = \sup_{x \in A} \#\sigma'(xa) \leq \infty.$$

- This definition of rank generalizes the classical rank of an operator.

# Finite Rank Elements and the Socle

- Following B. Aupetit and H. du T. Mouton, we define the **rank** of  $a \in A$  by

$$\text{rank}^\sigma(a) = \sup_{x \in A} \#\sigma'(xa) \leq \infty.$$

- This definition of rank generalizes the classical rank of an operator.
- Moreover, it satisfies all the classical properties such as subadditivity, lower-semicontinuity, and so forth.

# Finite Rank Elements and the Socle

- Following B. Aupetit and H. du T. Mouton, we define the **rank** of  $a \in A$  by

$$\text{rank}^\sigma(a) = \sup_{x \in A} \#\sigma'(xa) \leq \infty.$$

- This definition of rank generalizes the classical rank of an operator.
- Moreover, it satisfies all the classical properties such as subadditivity, lower-semicontinuity, and so forth.
- If  $A$  is semisimple then  $\text{soc}(A) = \{a \in A : \text{rank}^\sigma(a) < \infty\}$ .  
(Aupetit-Mouton, 1996)

# Trace, Determinant and Multiplicity

- For  $a \in \text{soc}(A)$ , Aupetit and Mouton define the **trace** of  $a$  and the **determinant** of  $\mathbf{1} + a$  by

$$\text{tr}(a) = \sum_{\alpha \in \sigma(a)} \alpha m(\alpha, a)$$

and

$$\det(\mathbf{1} + a) = \prod_{\alpha \in \sigma(a)} (1 + \alpha)^{m(\alpha, a)},$$

respectively.

# Trace, Determinant and Multiplicity

- For  $a \in \text{soc}(A)$ , Aupetit and Mouton define the **trace** of  $a$  and the **determinant** of  $\mathbf{1} + a$  by

$$\text{tr}(a) = \sum_{\alpha \in \sigma(a)} \alpha m(\alpha, a)$$

and

$$\det(\mathbf{1} + a) = \prod_{\alpha \in \sigma(a)} (1 + \alpha)^{m(\alpha, a)},$$

respectively.

- Here  $m(\alpha, a)$  is the **multiplicity** of  $a$  at  $\alpha$ .

# Rank One Elements and the Trace

- Denote the set of rank one elements of  $A$  by  $\mathcal{F}_1(A)$ .

# Rank One Elements and the Trace

- Denote the set of rank one elements of  $A$  by  $\mathcal{F}_1(A)$ .
- Then for any  $x \in \mathcal{F}_1(A)$ , we have that  $\text{tr}(x) = 0$  or  $\sigma'(x) = \{\text{tr}(x)\}$ .

# Rank One Elements and the Trace

- Denote the set of rank one elements of  $A$  by  $\mathcal{F}_1(A)$ .
- Then for any  $x \in \mathcal{F}_1(A)$ , we have that  $\text{tr}(x) = 0$  or  $\sigma'(x) = \{\text{tr}(x)\}$ .
- Now,  $\text{tr}$  is a linear functional on  $\text{soc}(A)$ . ([Aupetit-Mouton, 1996](#); [Braatvedt-Brits-S., 2015](#))

# Rank One Elements and the Trace

- Denote the set of rank one elements of  $A$  by  $\mathcal{F}_1(A)$ .
- Then for any  $x \in \mathcal{F}_1(A)$ , we have that  $\text{tr}(x) = 0$  or  $\sigma'(x) = \{\text{tr}(x)\}$ .
- Now,  $\text{tr}$  is a linear functional on  $\text{soc}(A)$ . (Aupetit-Mouton, 1996; Braatvedt-Brits-S., 2015)
- Moreover, if  $A$  is semisimple, then every  $a \in \text{soc}(A)$  can be written as a finite sum of rank one elements. (Aupetit-Mouton, 1996)

# Rank One Elements and the Trace

- Denote the set of rank one elements of  $A$  by  $\mathcal{F}_1(A)$ .
- Then for any  $x \in \mathcal{F}_1(A)$ , we have that  $\text{tr}(x) = 0$  or  $\sigma'(x) = \{\text{tr}(x)\}$ .
- Now,  $\text{tr}$  is a linear functional on  $\text{soc}(A)$ . (Aupetit-Mouton, 1996; Braatvedt-Brits-S., 2015)
- Moreover, if  $A$  is semisimple, then every  $a \in \text{soc}(A)$  can be written as a finite sum of rank one elements. (Aupetit-Mouton, 1996)

## Theorem (Aupetit-Mouton, 1996)

Let  $A$  be semisimple and let  $a \in A$ . If  $\text{tr}(ax) = 0$  for each  $x \in \text{soc}(A)$ , then  $a \in \text{soc}(A) = \{\mathbf{0}\}$ . Moreover, if  $a \in \text{soc}(A)$ , then  $a = \mathbf{0}$ .

# Spectrally Additive Maps – A Motivation

## Theorem (Gleason-Kahane-Żelazko, 1967, 1968)

If a linear functional  $f : A \rightarrow \mathbb{C}$  maps every  $x \in A$  into its spectrum  $\sigma(x)$ , then  $f$  is multiplicative.

# Spectrally Additive Maps – A Motivation

## Theorem (Gleason-Kahane-Żelazko, 1967, 1968)

If a linear functional  $f : A \rightarrow \mathbb{C}$  maps every  $x \in A$  into its spectrum  $\sigma(x)$ , then  $f$  is multiplicative.

## Theorem (Kowalski-Słodkowski, 1980)

Every functional  $f$  on  $A$  satisfying  $f(x) + f(y) \in \sigma(x + y)$  for each  $x, y \in A$  is linear and multiplicative.

# Spectrally Additive Maps – A Motivation

## Theorem (Gleason-Kahane-Żelazko, 1967, 1968)

If a linear functional  $f : A \rightarrow \mathbb{C}$  maps every  $x \in A$  into its spectrum  $\sigma(x)$ , then  $f$  is multiplicative.

## Theorem (Kowalski-Słodkowski, 1980)

Every functional  $f$  on  $A$  satisfying  $f(x) + f(y) \in \sigma(x + y)$  for each  $x, y \in A$  is linear and multiplicative.

In view of this it seems quite natural to ask if it is possible to do the same with linear spectrum preserving maps?

# Spectrally Additive Maps – A Motivation

## Theorem (Gleason-Kahane-Żelazko, 1967, 1968)

If a linear functional  $f : A \rightarrow \mathbb{C}$  maps every  $x \in A$  into its spectrum  $\sigma(x)$ , then  $f$  is multiplicative.

## Theorem (Kowalski-Słodkowski, 1980)

Every functional  $f$  on  $A$  satisfying  $f(x) + f(y) \in \sigma(x + y)$  for each  $x, y \in A$  is linear and multiplicative.

In view of this it seems quite natural to ask if it is possible to do the same with linear spectrum preserving maps?

More precisely, if a surjective map  $\phi$  (with no linearity or even additivity assumed) only has the property that  $\sigma(\phi(x) + \phi(y)) = \sigma(x + y)$  for each  $x, y$  in the domain of  $\phi$ , is  $\phi$  a Jordan-isomorphism?

# Spectrally Additive Group Homomorphisms

## Theorem (Askes-Brits-S., 2022)

Let  $A$  be semisimple and suppose that  $\phi : A \rightarrow B$  is a surjective map with the property that  $\sigma(x \pm y) = \sigma(\phi(x) \pm \phi(y))$  for all  $x, y \in A$ . Then:

# Spectrally Additive Group Homomorphisms

## Theorem (Askes-Brits-S., 2022)

Let  $A$  be semisimple and suppose that  $\phi : A \rightarrow B$  is a surjective map with the property that  $\sigma(x \pm y) = \sigma(\phi(x) \pm \phi(y))$  for all  $x, y \in A$ . Then:

- (a)  $(\phi(\alpha x + \beta y) - \alpha\phi(x) - \beta\phi(y)) \text{soc}(B) = \{\mathbf{0}\}$  for all  $x, y \in A$  and any  $\alpha, \beta \in \mathbb{C}$ .
- (b)  $(\phi(x^2) - \phi(x)^2) \text{soc}(B) = \{\mathbf{0}\}$  for all  $x \in A$ .

# Spectrally Additive Group Homomorphisms

## Theorem (Askes-Brits-S., 2022)

Let  $A$  be semisimple and suppose that  $\phi : A \rightarrow B$  is a surjective map with the property that  $\sigma(x \pm y) = \sigma(\phi(x) \pm \phi(y))$  for all  $x, y \in A$ . Then:

- (a)  $(\phi(\alpha x + \beta y) - \alpha\phi(x) - \beta\phi(y)) \text{soc}(B) = \{\mathbf{0}\}$  for all  $x, y \in A$  and any  $\alpha, \beta \in \mathbb{C}$ .
- (b)  $(\phi(x^2) - \phi(x)^2) \text{soc}(B) = \{\mathbf{0}\}$  for all  $x \in A$ .

In particular, if either  $\text{soc}(A)$  or  $\text{soc}(B)$  are essential, then  $\phi : A \rightarrow B$  is a continuous Jordan-isomorphism.

# Spectrally Additive Group Homomorphisms

## Theorem (Askes-Brits-S., 2022)

Let  $A$  be semisimple and suppose that  $\phi : A \rightarrow B$  is a surjective map with the property that  $\sigma(x \pm y) = \sigma(\phi(x) \pm \phi(y))$  for all  $x, y \in A$ . Then:

- (a)  $(\phi(\alpha x + \beta y) - \alpha\phi(x) - \beta\phi(y)) \text{soc}(B) = \{\mathbf{0}\}$  for all  $x, y \in A$  and any  $\alpha, \beta \in \mathbb{C}$ .
- (b)  $(\phi(x^2) - \phi(x)^2) \text{soc}(B) = \{\mathbf{0}\}$  for all  $x \in A$ .

In particular, if either  $\text{soc}(A)$  or  $\text{soc}(B)$  are essential, then  $\phi : A \rightarrow B$  is a continuous Jordan-isomorphism. Moreover, if either  $A$  or  $B$  is a prime algebra with a nonzero socle, then  $\phi$  is continuous and is either an (algebra) isomorphism or anti-isomorphism.

# An Additive Characterization of Finite Rank Elements

## Theorem (Askes-Brits-S., 2022)

Suppose that  $A$  is semisimple. Let  $a \in A$ , let  $m \in \mathbb{N}$ , and let  $K$  be any subset of  $\mathbb{C}$  with at least  $m + 1$  nonzero elements. Then the following are equivalent:

- (a)  $\text{rank}^\sigma(a) = \sup_{x \in A} \#\sigma'(xa) = m.$
- (b)  $\sup_{y \in G(A)} \#\{t \in K : y + ta \notin G(A)\} = m.$

# An Additive Characterization of Finite Rank Elements

## Theorem (Askes-Brits-S., 2022)

Suppose that  $A$  is semisimple. Let  $a \in A$ , let  $m \in \mathbb{N}$ , and let  $K$  be any subset of  $\mathbb{C}$  with at least  $m + 1$  nonzero elements. Then the following are equivalent:

- (a)  $\text{rank}^\sigma(a) = \sup_{x \in A} \#\sigma'(xa) = m.$
- (b)  $\sup_{y \in G(A)} \#\{t \in K : y + ta \notin G(A)\} = m.$

With  $K = \{-1, 1\}$  we readily obtain that a spectrally additive group homomorphism preserves rank one elements in both directions.

# Spectrally Additive Group Homomorphisms

Indeed, notice that if  $\phi : A \rightarrow B$  is a spectrally additive group homomorphism, then

$$0 \in \sigma(y \pm a) \iff 0 \in \sigma(\phi(y) \pm \phi(a));$$

# Spectrally Additive Group Homomorphisms

Indeed, notice that if  $\phi : A \rightarrow B$  is a spectrally additive group homomorphism, then

$$0 \in \sigma(y \pm a) \iff 0 \in \sigma(\phi(y) \pm \phi(a));$$

that is,

$$y \pm a \notin G(A) \iff \phi(y) \pm \phi(a) \notin G(B).$$

# Spectrally Additive Group Homomorphisms

Indeed, notice that if  $\phi : A \rightarrow B$  is a spectrally additive group homomorphism, then

$$0 \in \sigma(y \pm a) \iff 0 \in \sigma(\phi(y) \pm \phi(a));$$

that is,

$$y \pm a \notin G(A) \iff \phi(y) \pm \phi(a) \notin G(B).$$

## Corollary (Askes-Brits-S., 2022)

Suppose that  $A$  is semisimple. If  $\phi : A \rightarrow B$  is a spectrally additive group homomorphism, then  $B$  is semisimple and  $\phi(\mathcal{F}_1(A)) = \mathcal{F}_1(B)$ .

# Is Spectrally Additive enough?

## Theorem (Askes-Brits-S., 2022)

Suppose that  $A$  is semisimple. Let  $a \in A$ , let  $m \in \mathbb{N}$ , and let  $K$  be any subset of  $\mathbb{C}$  with at least  $m + 1$  nonzero elements. Then the following are equivalent:

- (a)  $\text{rank}^\sigma(a) = \sup_{x \in A} \#\sigma'(xa) = m.$
- (b)  $\sup_{y \in G(A)} \#\{t \in K : y + ta \notin G(A)\} = m.$

Since the set  $K$  in the theorem must contain at least two nonzero elements to characterize rank one elements, if  $\phi$  is only *spectrally additive*, then this result cannot be used directly to obtain that  $\phi(\mathcal{F}_1(A)) = \mathcal{F}_1(B)$ .

# A New Characterization of Rank One Elements

## Theorem (Havlicek-Šemrl, 2006)

Let  $H$  be an infinite dimensional Hilbert space. Then an operator  $B \in \mathcal{L}(H)$  has rank one if and only if there exists some  $R \in \mathcal{L}(H)$ , with  $R \neq \mathbf{0}$  and  $R \neq B$ , such that for every  $X \in \mathcal{L}(H)$ ,

$$X + R \in G(\mathcal{L}(H)) \implies X \in G(\mathcal{L}(H)) \text{ or } X + B \in G(\mathcal{L}(H)).$$

# A New Characterization of Rank One Elements

## Theorem (Havlicek-Šemrl, 2006)

Let  $H$  be an infinite dimensional Hilbert space. Then an operator  $B \in \mathcal{L}(H)$  has rank one if and only if there exists some  $R \in \mathcal{L}(H)$ , with  $R \neq \mathbf{0}$  and  $R \neq B$ , such that for every  $X \in \mathcal{L}(H)$ ,

$$X + R \in G(\mathcal{L}(H)) \implies X \in G(\mathcal{L}(H)) \text{ or } X + B \in G(\mathcal{L}(H)).$$

## Theorem (S., 2022)

Let  $A$  be semisimple and let  $b \in A \setminus \{\mathbf{0}\}$ . Then  $\text{rank}^\sigma(b) = 1$  if and only if there exists some  $r \in A$  such that for any  $x \in A$ , we have

- (i)  $x \in G(A) \implies x + r \in G(A) \text{ or } x + b \in G(A)$ ;
- (ii)  $x + r \in G(A) \implies x \in G(A) \text{ or } x + b \in G(A)$ ;
- (iii)  $x \notin G(A) \text{ and } x + b \in G(A) \implies x + r \in G(A)$ .

# Spectrally Additive Maps

## Proposition (Askes-Brits-S., 2022)

Suppose that  $A$  is semisimple and that  $\phi : A \rightarrow B$  is a spectrally additive map. Then:

- (a) For any  $x, y \in A$ ,  $x + y \in G(A) \iff \phi(x) + \phi(y) \in G(B)$ .
- (b)  $\phi$  is spectrum-preserving and  $\phi(\mathbf{0}) = \mathbf{0}$ .
- (c)  $\phi(G(A)) = G(B)$ .
- (d)  $\phi$  is injective.
- (e)  $B$  is semisimple.
- (f)  $\phi(\lambda \mathbf{1} + x) = \lambda \mathbf{1} + \phi(x)$  for each  $\lambda \in \mathbb{C}$  and  $x \in A$ .

(Aupetit-Mouton, 1996)

# Spectrally Additive Maps

## Lemma (Askes-Brits-S., 2022)

Let  $x \in \text{soc}(A)$  with  $\sigma'(x) = \{\alpha\}$  and  $m(\alpha, x) = k$ . Then  $m(\alpha^2, x^2) = k$ .

## Lemma (Askes-Brits-S., 2022)

Let  $x \in \text{soc}(A)$  with  $\sigma'(x) = \{\alpha, -\alpha\}$  and  $m(\alpha, x) = m(-\alpha, x) = k$ . Then  $m(\alpha^2, x^2) = 2k$ .

# Spectrally Additive Maps

## Lemma (Askes-Brits-S., 2022)

Let  $x \in \text{soc}(A)$  with  $\sigma'(x) = \{\alpha\}$  and  $m(\alpha, x) = k$ . Then  $m(\alpha^2, x^2) = k$ .

## Lemma (Askes-Brits-S., 2022)

Let  $x \in \text{soc}(A)$  with  $\sigma'(x) = \{\alpha, -\alpha\}$  and  $m(\alpha, x) = m(-\alpha, x) = k$ . Then  $m(\alpha^2, x^2) = 2k$ .

From this we are able to show, with a bit of effort, that

$$\text{tr}((a + b)^2) = \text{tr}((\phi(a) + \phi(b))^2) \text{ for all } a, b \in \mathcal{F}_1(A).$$

# Spectrally Additive Maps

## Lemma (Askes-Brits-S., 2022)

Let  $x \in \text{soc}(A)$  with  $\sigma'(x) = \{\alpha\}$  and  $m(\alpha, x) = k$ . Then  $m(\alpha^2, x^2) = k$ .

## Lemma (Askes-Brits-S., 2022)

Let  $x \in \text{soc}(A)$  with  $\sigma'(x) = \{\alpha, -\alpha\}$  and  $m(\alpha, x) = m(-\alpha, x) = k$ . Then  $m(\alpha^2, x^2) = 2k$ .

From this we are able to show, with a bit of effort, that

$$\text{tr}((a + b)^2) = \text{tr}((\phi(a) + \phi(b))^2) \text{ for all } a, b \in \mathcal{F}_1(A).$$

Hence, from the linearity and cyclic property of the trace, we obtain that

$$\text{tr}(a^2) + 2 \text{tr}(ab) + \text{tr}(b^2) = \text{tr}(\phi(a)^2) + 2 \text{tr}(\phi(a)\phi(b)) + \text{tr}(\phi(b)^2)$$

for all  $a, b \in \mathcal{F}_1(A)$ .

# Spectrally Additive Maps

## Theorem (Askes-Brits-S., 2022)

Let  $A$  be semisimple and let  $\phi : A \rightarrow B$  be a spectrally additive map. Then

$$\operatorname{tr}(ab) = \operatorname{tr}(\phi(a)\phi(b)) \text{ for all } a, b \in \mathcal{F}_1(A).$$

Thus, we conclude that  $\phi$  is homogeneous on  $\mathcal{F}_1(A)$ .

# Spectrally Additive Maps

## Theorem (Askes-Brits-S., 2022)

Let  $A$  be semisimple and let  $\phi : A \rightarrow B$  be a spectrally additive map. Then

$$\operatorname{tr}(ab) = \operatorname{tr}(\phi(a)\phi(b)) \text{ for all } a, b \in \mathcal{F}_1(A).$$

Thus, we conclude that  $\phi$  is homogeneous on  $\mathcal{F}_1(A)$ .

## Lemma (Askes-Brits-S., 2022)

Let  $A$  be semisimple and let  $\phi : A \rightarrow B$  be a spectrally additive map. Then

$$\operatorname{tr}(x^{-1}a) = \operatorname{tr}(\phi(x)^{-1}\phi(a)) \text{ for all } x \in G(A) \text{ and } a \in \mathcal{F}_1(A).$$

# Spectrally Additive Maps

Hence,

$$\operatorname{tr}((- \lambda \mathbf{1} + x)^{-1} a) = \operatorname{tr}(\phi(- \lambda \mathbf{1} + x)^{-1} \phi(a)) = \operatorname{tr}((- \lambda \mathbf{1} + \phi(x))^{-1} \phi(a))$$

for all  $x \in A$  and  $\lambda \in \mathbb{C}$  with  $|\lambda|$  sufficiently large.

# Spectrally Additive Maps

Hence,

$$\operatorname{tr}((-\lambda \mathbf{1} + x)^{-1} a) = \operatorname{tr}(\phi(-\lambda \mathbf{1} + x)^{-1} \phi(a)) = \operatorname{tr}((-\lambda \mathbf{1} + \phi(x))^{-1} \phi(a))$$

for all  $x \in A$  and  $\lambda \in \mathbb{C}$  with  $|\lambda|$  sufficiently large.

## Lemma (Askes-Brits-S., 2022)

Let  $A$  be semisimple and suppose that  $\phi : A \rightarrow B$  is a spectrally additive map. Then for any  $x \in A$  and  $a \in \mathcal{F}_1(A)$ , we have

$$\operatorname{tr}(x^n a) = \operatorname{tr}(\phi(x)^n \phi(a)) \text{ for all } n \in \mathbb{N}.$$

# Spectrally Additive Maps

Hence,

$$\operatorname{tr}((- \lambda \mathbf{1} + x)^{-1} a) = \operatorname{tr}(\phi(- \lambda \mathbf{1} + x)^{-1} \phi(a)) = \operatorname{tr}((- \lambda \mathbf{1} + \phi(x))^{-1} \phi(a))$$

for all  $x \in A$  and  $\lambda \in \mathbb{C}$  with  $|\lambda|$  sufficiently large.

## Lemma (Askes-Brits-S., 2022)

Let  $A$  be semisimple and suppose that  $\phi : A \rightarrow B$  is a spectrally additive map. Then for any  $x \in A$  and  $a \in \mathcal{F}_1(A)$ , we have

$$\operatorname{tr}(x^n a) = \operatorname{tr}(\phi(x)^n \phi(a)) \text{ for all } n \in \mathbb{N}.$$

From this one now deduces that

- (a)'  $\operatorname{tr}((\phi(\alpha x + \beta y) - \alpha \phi(x) - \beta \phi(y)) b) = 0$  for all  $x, y \in A$ ,  $\alpha, \beta \in \mathbb{C}$  and  $b \in \operatorname{soc}(B)$ ;
- (b)'  $\operatorname{tr}((\phi(x^2) - \phi(x)^2) b) = 0$  for all  $x \in A$  and  $b \in \operatorname{soc}(B)$ .

# Spectrally Additive Maps

## Theorem (S., 2022)

Let  $A$  be semisimple and suppose that  $\phi : A \rightarrow B$  is a spectrally additive map. Then:

- (a)  $(\phi(\alpha x + \beta y) - \alpha\phi(x) - \beta\phi(y)) \text{soc}(B) = \{\mathbf{0}\}$  for all  $x, y \in A$  and any  $\alpha, \beta \in \mathbb{C}$ .
- (b)  $(\phi(x^2) - \phi(x)^2) \text{soc}(B) = \{\mathbf{0}\}$  for all  $x \in A$ .

In particular, if either  $\text{soc}(A)$  or  $\text{soc}(B)$  are essential, then  $\phi : A \rightarrow B$  is a continuous Jordan-isomorphism.

## Corollary (S., 2022)

Let  $A$  be semisimple and suppose that  $\phi : A \rightarrow B$  is a spectrally additive map. If either  $A$  or  $B$  is a prime algebra with a nonzero socle, then  $\phi$  is continuous and is either an (algebra) isomorphism or anti-isomorphism.
