A, B unital C*-algebra and let $T : A \rightarrow B$ be contractive

 $T(1) = 1 \quad \Leftrightarrow \quad T \ge 0$

◆□▶ ◆御▶ ◆臣▶ ◆臣▶ 三臣 - のへで

In particular $T(x^*) = T(x)^*$.

A, B unital C*-algebra and let $T : A \rightarrow B$ be contractive

$$T(1) = 1 \quad \Leftrightarrow \quad T \ge 0$$

In particular $T(x^*) = T(x)^*$.

We say that *T* is completely contractive if $T \otimes id : M_n(A) \rightarrow M_n(B)$ is contractive.

We say that *T* is completely positive if $T \otimes id : M_n(A) \rightarrow M_n(B)$ is positive for all $n \ge 1$.

Actually if T(1) = 1, then *T* is (completely) contractive \Leftrightarrow *T* is (completely) positive

▲ロト ▲団ト ▲ヨト ▲ヨト 三ヨー わらぐ

Recall that Jordan product is defined by

$$x \circ y = \frac{xy + yx}{2}$$

$$x \circ x^* = Re(x)^2 + Im(x)^2$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへで

Recall that Jordan product is defined by

$$x \circ y = \frac{xy + yx}{2}$$

$$x \circ x^* = Re(x)^2 + Im(x)^2$$

Kadison's inequality

Assume T(1) = 1 and T is contractive (or positive), then

$$\forall x \in A, \qquad T(x \circ x^*) \ge T(x) \circ T(x)^*$$

If *T* is 2-positive then

$$\forall x \in A, \qquad T(xx^*) \geq T(x)T(x)^*$$

▲ロト ▲団ト ▲ヨト ▲ヨト 三ヨー わらぐ

If *T* is unital cp then $T(x) = a^* \pi(x) a$ with π a unital *-representation and $a^*a = 1$:

$$T(xx^*) - T(x)T(x)^* = a^*\pi(x)(1 - aa^*)\pi(x)^*a \ge 0$$

◆□▶ ◆御▶ ◆臣▶ ◆臣▶ 三臣 - のへで

If *T* is unital cp then $T(x) = a^* \pi(x) a$ with π a unital *-representation and $a^*a = 1$:

$$T(xx^*) - T(x)T(x)^* = a^*\pi(x)(1 - aa^*)\pi(x)^*a \ge 0$$

◆□▶ ◆□▶ ◆□▶ ◆□▶ ●□ ● ●

Considering, the sesquilinear map $(x, y) \mapsto T(xy^*) - T(x)T(y)^*$ If $T(xx^*) - T(x)T(x)^*$ then for all $y \in A$, T(xy) = T(x)T(y)

If *T* is unital cp then $T(x) = a^* \pi(x) a$ with π a unital *-representation and $a^*a = 1$:

$$T(xx^*) - T(x)T(x)^* = a^*\pi(x)(1 - aa^*)\pi(x)^*a \ge 0$$

Considering, the sesquilinear map $(x, y) \mapsto T(xy^*) - T(x)T(y)^*$ If $T(xx^*) - T(x)T(x)^*$ then for all $y \in A$, T(xy) = T(x)T(y)

Multiplicative domain

Assume T(1) = 1 and T is completely contractive, then

$$L = \{x \mid T(xx^*) = T(x)T(x)^*\} = \{x \mid \forall y, T(xy) = T(x)T(y)^*\}$$

▲ロト ▲団ト ▲ヨト ▲ヨト 三ヨー わらぐ

L is called the left multiplicative domain. $R \cap L$ is a C^* -algebra.

Similarly,

Jordan Multiplicative domain

Assume T(1) = 1 and T is contractive, then

$$M = \{x \mid T(x \circ x^*) = T(x) \circ T(x)^*\} = \{x \mid \forall y, T(x \circ y) = T(x) \circ T(y)^*\}$$

▲ロト ▲団ト ▲ヨト ▲ヨト 三ヨー わらぐ

M is a Jordan algebra

Beware that the Jordan product is not associative.

An application

Korovkin's Theorem

Let $T_n : C([0,1]) \to C([0,1])$ be a sequence of unital positive maps such that $||T_n(x) - x|| \to 0$ and $||T_n(x^2) - x^2||$, then for any $f \in C([0,1])$, $||T_n(f) - f|| \to 0$

《曰》 《聞》 《臣》 《臣》 三臣 …

An application

Korovkin's Theorem

Let $T_n : C([0,1]) \to C([0,1])$ be a sequence of unital positive maps such that $||T_n(x) - x|| \to 0$ and $||T_n(x^2) - x^2||$, then for any $f \in C([0,1])$, $||T_n(f) - f|| \to 0$

 $A = B = \prod_{\mathfrak{U}} C[0, 1], T = \prod_{\mathfrak{U}} T_n$, then by assumption T(x) = x and x is in the multiplicative domain, hence T(f) = f for all $f \in C([0, 1])$ by Weierstrass' theorem.

▲ロト ▲団ト ▲ヨト ▲ヨト 三ヨー わらぐ

What can be said if one drop the assumption to $||T|| < 1 + \varepsilon$? It is clear that one looses positivity! What can be said if one drop the assumption to $||T|| < 1 + \varepsilon$? It is clear that one looses positivity!

Since we have algebraic characterization, one can use

The ultraproduct argument

For every $\delta > 0$, there exists $\varepsilon > 0$ such that for any $T : A \to B$ with T(1) = 1 and $||T|| < 1 + \varepsilon$ and any $x \in A^+$ with ||x|| = 1,

 $dist(T(x), B^+) < \delta$

《曰》 《聞》 《臣》 《臣》 三臣 …

What can be said if one drop the assumption to $||T|| < 1 + \varepsilon$? It is clear that one looses positivity!

Since we have algebraic characterization, one can use

The ultraproduct argument

For every $\delta > 0$, there exists $\varepsilon > 0$ such that for any $T : A \to B$ with T(1) = 1 and $||T|| < 1 + \varepsilon$ and any $x \in A^+$ with ||x|| = 1,

 $dist(T(x), B^+) < \delta$

Pf : assume it is false, then there is $\delta > 0$ and $\varepsilon_n \to 0$ and $T_n : A_n \to B_n$, $x_n \in A_n^+$ such that $dist(T_n(x_n), B^+) \ge \delta$. Let $A = \prod_{\mathfrak{U}} A_n$, $B = \prod_{\mathfrak{U}} B_n$, $T = \prod_{\mathfrak{U}} T_n$ and $x = (x_n)$. Then *T* is positive thus $T(x) \ge 0$, but then $0 = \lim dist(T_n(x_n), B^+)$.

▲ロト ▲団ト ▲ヨト ▲ヨト 三ヨー わらぐ

It can be applied in many situations but it has a major drawback it is not explicit.

With Jean Roydor, we made them explicit

Examples of quantitative estimates

Let $T : A \rightarrow B$ with T(1) = 1 and $||T|| < 1 + \varepsilon$, then for any $x \in A$:

$$\|T(x)^* - T(x^*)\| \leq 4\sqrt{2\varepsilon + \varepsilon^2} \|x\|$$

 $\begin{aligned} \|K_{T}(x,y)\| &\leq 2(\|K_{T}(x,x)\| + \delta_{\varepsilon} \|x\|^{2})^{1/2} (\|K_{T}(y,y)\| + \delta_{\varepsilon} \|x\|^{2})^{1/2} + v_{\varepsilon} \|x\| \|y\|, \\ \text{where } K_{T}(x,y) &= T(x^{*} \circ y) - T(x^{*}) \circ T(y) \text{ and } \delta_{\varepsilon} = 2(4+3\varepsilon)\sqrt{2\varepsilon+\varepsilon^{2}} \\ \text{and } v_{\varepsilon} &= 2(5+4\varepsilon)\sqrt{2\varepsilon+\varepsilon^{2}}. \end{aligned}$

▲ロト ▲団ト ▲ヨト ▲ヨト 三ヨー わらぐ

To any *G* s.c. locally compact group, one can associate several algebras.

◆□▶ ◆御▶ ◆臣▶ ◆臣▶ 三臣 - のへで

A natural question is to know how they remember the group. Example : $L_1(G)$ To any *G* s.c. locally compact group, one can associate several algebras.

A natural question is to know how they remember the group. Example : $L_1(G)$

At Banach space level, isometrically $L_1(G)$ only remembers the measure space (G, μ) . If ones want the group structure one has to take the convolution * product into account:

Wendel's thms (1951, 1952)

If there is an isometric algebra isomorphism $(L_1(G), *) \rightarrow (L_1(H), *)$ then *G* and *H* are homeomorphic as topological groups.

If there is a contractive algebra isomorphism $(L_1(G), *) \rightarrow (L_1(H), *)$ then *G* and *H* are homeomorphic as topological groups.

Johnson and Rigelhof also did it for measure algebras.

The assumption in Wendel's theorem can be relaxed a little bit

Kalton and Wood (1976)

Assume that $T : (L_1(G), *) \rightarrow (L_1(H), *)$ is an algebra isomorphism with norm less than 1.247 then *G* and *H* are homeomorphic as topological groups.

If G and H are abelian, one can take $\sqrt{2}$, this is the best possible.

<ロト <回ト < 国ト < 国ト = 国

Ш

G s.c. locally countable group $\omega: G \rightarrow B(K)$ the universal unitary representation of G

$$B(G) = \{g \mapsto \langle \omega(g)\xi, \eta \rangle; \xi, \eta \in K\}$$

$$\|I\|_{B(G)} = \inf\{\|\xi\|, \|\eta\|; I(g) = (\omega(g)\xi, \eta)\}$$

With the pointwise product, the Fourier-Stieltjes algebra (B(G), .) is a Banach algebra.

$$B(G) = C^*(G)^*, \qquad B(G)^* = W(G) = \{\omega(g) ; g \in G\}''$$

▲ロト ▲団ト ▲ヨト ▲ヨト 三ヨー わらぐ

The Fourier algebra

 $\lambda : G \rightarrow B(L_2(G, \mu))$ the left regular representation of *G*

$$\boldsymbol{A}(\boldsymbol{G}) = \{\boldsymbol{g} \mapsto \langle \lambda(\boldsymbol{g})\xi, \eta \rangle ; \xi, \eta \in \boldsymbol{L}_{2}(\boldsymbol{G})\}$$

This is the same as considering

$$\begin{aligned} \mathcal{A}(G) &= \{ g \mapsto \langle \sum_{i=1}^{\infty} \lambda(g)\xi_i, \eta_i \rangle ; \xi_i, \eta_i \in L_2(G), \sum \|\xi_i\| . \|\eta_i\| < \infty \} \\ &\| f\|_{\mathcal{A}(G)} = \inf\{ \|\xi\| . \|\eta\| ; f(g) = \langle \lambda(g)\xi, \eta \rangle \} \end{aligned}$$

With the pointwise product, the Fourier algebra (A(G), .) is a Banach algebra.

$$A(G) \subset C^*_c(G)^*, \qquad A(G)^* = L(G) = \{\lambda(g) ; g \in G\}''$$

 $A(G) \subset B(G)$ is isometrically a subspace and is an ideal

General problem : To understand algebra homomorphisms $\Phi: A(G) \rightarrow B(H)$?

◆□▶ ◆御▶ ◆臣▶ ◆臣▶ 三臣 - のへで

General problem : To understand algebra homomorphisms $\Phi: A(G) \rightarrow B(H)$?

They are automatically continuous (Silov).

We have $\sigma(A(G)) \simeq G$, it follows that

There exist an open subset $\Omega \subset H$ and a continuous map $\alpha : \Omega \to G$ such that

$$\Phi(f)(h) = \begin{cases} f(\alpha(h)) & \text{if } h \in \Omega \\ 0 & \text{if } h \notin \Omega \end{cases}$$

▲ロト ▲団ト ▲ヨト ▲ヨト 三ヨー わらぐ

Pb : find all α that works !

General problem : To understand algebra homomorphisms $\Phi: A(G) \rightarrow B(H)$?

▲ロト ▲団ト ▲ヨト ▲ヨト 三ヨー わらぐ

Pb : find all α that works !

Idea : to look at Φ^* !

Cohen (1960)

If *G* and *H* are abelian, this works iff α is a continuous piecewise affine map.

◆□▶ ◆□▶ ◆□▶ ◆□▶ ●□ ● ●

Cohen (1960)

If *G* and *H* are abelian, this works iff α is a continuous piecewise affine map.

Extensions by Host, Ilie

Ilie and Spronk (2005)

If *G* is amenable and *H* arbitrary, this also works for completely bounded homomorphisms iff α is a continuous piecewise affine map. This is fall if $G \supset F_2$.

By analogy with Wendel :

Walter (1972)

If there is an isometric algebra isomorphism $\Phi : A(G) \rightarrow A(H)$, then $G \simeq H$.

Moreover, we have $\Phi(f)(h) = f(g_0\tau(h_0^{-1}h))$ for τ a group isomorphism or anti-isomorphism for some $g_0 \in G$, $h_0 \in H$.

《曰》 《聞》 《臣》 《臣》 三臣 …

By analogy with Wendel :

Walter (1972)

If there is an isometric algebra isomorphism $\Phi : A(G) \rightarrow A(H)$, then $G \simeq H$.

Moreover, we have $\Phi(f)(h) = f(g_0 \tau(h_0^{-1}h))$ for τ a group isomorphism or anti-isomorphism for some $g_0 \in G$, $h_0 \in H$.

By analogy with Wendel 2 :

Le Pham (2010)

If there is an conctractive algebra homorphism $\Phi : A(G) \to B(H)$, There is an open subgroup Ω and τ a continuous group homomorphism or anti-homomorphism and $g_0 \in G$, $h_0 \in H$ so that

$$\Phi(f)(h) = \begin{cases} f(g_0 \tau(h_0^{-1}h)) & \text{if } h \in h_0 \Omega \\ 0 & \text{if } h \notin h_0 \Omega \end{cases}$$

▲ロト ▲団ト ▲ヨト ▲ヨト 三ヨー わらぐ

Pb : to relax the contractive assumption !

A first cb version, analogous to Kalton and Wood

Kuznetsova and Roydor (2015)

If there is an algebra homomorphism $\Phi : A(G) \to B(H)$ with $\|Id_{M_2} \otimes \Phi\| \leq \sqrt{5}/2$. Then, there is an open subgroup Ω and τ a group isomorphism and $g_0 \in G$, $h_0 \in H$ so that

$$\Phi(f)(h) = \begin{cases} f(g_0 \tau(h_0^{-1}h)) & \text{if } h \in h_0 \Omega \\ 0 & \text{if } h \notin h_0 \Omega \end{cases}$$

In particular $\|\Phi\|_{cb} \leq 1$.

The proof relies on some estimates on "almost multiplicative maps" between von Neumann algebras in a previous work of Roydor and myself.

《曰》 《聞》 《臣》 《臣》 三臣 …

Using the ultraproduct argument :

Kuznetsova and Roydor (2015)

There is some $\varepsilon > 0$ so that if $T : A(G) \to A(H)$ is an algebra homomorphism with $||T|| . ||T^{-1}|| < 1 + \varepsilon$ then we have $\Phi(f)(h) = f(g_0\tau(h_0^{-1}h))$ for τ a group isomorphism or anti-isomorphism for some $g_0 \in G$, $h_0 \in H$. In particular $||T|| = ||T^{-1}|| = 1$.

This is not totally satisfactory because it is in term of the distortion of *T*.

《曰》 《聞》 《臣》 《臣》 三臣 …

R. and Roydor

If $T : A(G) \to A(H)$ is an algebra isomorphism with ||T|| < 1.0005 then we have $\Phi(f)(h) = f(g_0 \tau(h_0^{-1}h))$ for τ a group isomorphism or anti-isomorphism for some $g_0 \in G$, $h_0 \in H$. In particular $||T|| = ||T^{-1}|| = 1$.

R. and Roydor

If there is an algebra homomorphism $\Phi : A(G) \to B(H)$ with $\|\Phi\| \leq 1.00018$. Then, there is an open subgroup Ω and τ a group morphism and $g_0 \in G$, $h_0 \in H$ so that

$$\Phi(f)(h) = \begin{cases} f(g_0 \tau(h_0^{-1}h)) & \text{if } h \in h_0 \Omega \\ 0 & \text{if } h \notin h_0 \Omega \end{cases}$$

▲ロト ▲母ト ▲臣ト ▲臣ト 三臣 … のへで

In particular $\|\Phi\|_{cb} \leq 1$.

Ideas of the proof : Look at $\Phi^* : W^*(H) \to L(G)$, assume $\Phi \emptyset$, then there is some $h_0 \in H$ such that $\Phi(\omega_{h_0}) = \lambda_{g_0}$.

◆□▶ ◆御▶ ◆臣▶ ◆臣▶ 三臣 - のへで

Ideas of the proof : Look at $\Phi^* : W^*(H) \to L(G)$, assume $\Phi \emptyset$, then there is some $h_0 \in H$ such that $\Phi(\omega_{h_0}) = \lambda_{g_0}$.

Do appropriate translations to define a unital $T : W^*(H) \rightarrow L(G)$ with $||T|| = ||\Phi||$ (as well as Ω ; assume $\Omega = H$). Hence *T* is almost positive !

◆□▶ ◆□▶ ◆□▶ ◆□▶ ●□ ● ●

We must have $T(\omega_h) = \lambda_{f(h)}$. Thus $T(\omega_h \circ \omega_h^*) \approx T(\omega_h) \circ T(\omega_h)^*$.

Hence T is almost Jordan multiplicative on generators.

Two easy lemmas to conclude

Lemma 1

Unless there are trivial simplifications to make it 0

$$\|\lambda_{g_1} + \lambda_{g_2} - \lambda_{g_3} - \lambda_{g_4}\| \ge \sqrt{3}$$

Two easy lemmas to conclude

Lemma 1

Unless there are trivial simplifications to make it 0

$$\|\lambda_{g_1} + \lambda_{g_2} - \lambda_{g_3} - \lambda_{g_4}\| \ge \sqrt{3}$$

▲ロト ▲団ト ▲ヨト ▲ヨト 三ヨー わらぐ

 $T(\omega_{h_1h_2}) + T(\omega_{h_1h_2}) - T(\omega_{h_1})T(\omega_{h_2}) - T(\omega_{h_2})T(\omega_{h_2}) \text{ is small}$ i.e. $\lambda_{f(h_1h_2)} + \lambda_{f(h_2h_1)} - \lambda_{f(h_2)f(h_1)} - \lambda_{f(h_2)f(h_1)} = 0$

Two easy lemmas to conclude

Lemma 1

Unless there are trivial simplifications to make it 0

$$\|\lambda_{g_1} + \lambda_{g_2} - \lambda_{g_3} - \lambda_{g_4}\| \ge \sqrt{3}$$

$$T(\omega_{h_1h_2}) + T(\omega_{h_1h_2}) - T(\omega_{h_1})T(\omega_{h_2}) - T(\omega_{h_2})T(\omega_{h_2}) \text{ is small}$$

i.e. $\lambda_{f(h_1h_2)} + \lambda_{f(h_2h_1)} - \lambda_{f(h_2)f(h_1)} - \lambda_{f(h_2)f(h_1)} = 0$

Lemma 2

Let $f : G \to H$ be a map such that $f(\{xy, yx\}) = \{f(x)f(y), f(y)f(x)\}$. Then *f* is a group morphism or a group anti-ismomorphism.

Another application of almost contractive maps

A non commutative Amir-Cambern theorem

 $d_{cb}(A, B) = \inf\{ \|T\|_{cb}, \|T^{-1}\|_{cb} ; T: A \to B \text{ cb-isomorphism} \}$

R. and Roydor

Let *A* be a separable nuclear *C*^{*}-algebra or a von Neumann algebra, then there exists an explicit $\varepsilon_0 > 0$ such that for any *C*^{*}-algebra *B*, the inequality $d_{cb}(A, B) < 1 + \varepsilon_0$ implies that *A* and *B* *-isomorphic as *C*^{*}-algebras or von Neumann algebras.

When *A* and *B* are C(K)-spaces $\varepsilon_0 = 1$!

This is false for non separable C^* -algebras or without cb (Connes) ! It relies on a deep result by Christensen, Sinclair, Smith and White for nuclear C^* -algebras.

It relies on *cb*-cohomology stuff for vN algebras.

Another application of almost multiplicativity

Assume *A* is a von Neumann with a nsf trace τ . One can define for $1 \le p < \infty$:

$$L_{\rho}(\mathbf{A}, \tau) = \text{closure of } \{\mathbf{x} \in \mathbf{A} \mid \tau(|\mathbf{x}|^{\rho}) < \infty\}$$

▲ロト ▲団ト ▲ヨト ▲ヨト 三ヨー わらぐ

with $||x||_{p}^{p} = \tau(|x|^{p})$.

Assume *A* is a von Neumann with a nsf trace τ . One can define for $1 \le p < \infty$:

$$L_{\rho}(\boldsymbol{A},\tau) = \text{closure of } \{\boldsymbol{x} \in \boldsymbol{A} \mid \tau(|\boldsymbol{x}|^{\rho}) < \infty\}$$

with $||x||_{p}^{p} = \tau(|x|^{p})$.

If $T : A \rightarrow A$ is unital and trace preserving then T extends to a contraction on all L_p -spaces.

Caspers, Parcet, Perrin and R.

For any $x \in L_{2p}(A)^+$

$$||T(x) - T(\sqrt{x})^2||_{2p} \le \frac{1}{2} ||T(x^2) - T(x)^2||_p^{1/2}.$$

▲ロト ▲母ト ▲臣ト ▲臣ト 三臣 … のへで

Caspers, Parcet, Perrin and R.

There is some C > 0 such that for any $x \in L_2^+$ and any $0 < \theta \leq 1$

$$\|T(x^{\theta})-x^{\theta}\|_{2/\theta} \leq C \|T(x)-x\|_2^{\theta/2} \|x\|_2^{\theta/2}.$$

It gives an answer to :

If *f* has Fourier support in $[-\varepsilon, \varepsilon]$, then f^2 has Fourier support in $[-2\varepsilon, 2\varepsilon]$. What about the opposite ?

Caspers, Parcet, Perrin and R.

There is some C > 0 such that for any $x \in L_2^+$ and any $0 < \theta \leq 1$

$$\|T(x^{\theta})-x^{\theta}\|_{2/\theta} \leq C \|T(x)-x\|_2^{\theta/2} \|x\|_2^{\theta/2}.$$

It gives an answer to :

If *f* has Fourier support in $[-\varepsilon, \varepsilon]$, then f^2 has Fourier support in $[-2\varepsilon, 2\varepsilon]$. What about the opposite ?

If *f* is positive in L_2 with Fourier support in $[-\varepsilon, \varepsilon]$, then \sqrt{f} must be close in L_4 to a function whose Fourier transform has support in $[-\varepsilon^{\alpha}, \varepsilon^{\alpha}]$ (0 < α < 1).

THANK YOU !
